Assignment 2 Report Marking Rubric 2026 (25%)

Criteria	High Distinction (80–100%)	Distinction (70-79%)	Credit (60-69%)	Pass (50-59%)	Unsatisfactory (<50%)
Significant, relevant research coverage (5%)	Comprehensive coverage of all significant and relevant aspects of the topic. The key problems and challenges are clearly defined and discussed. Demonstrates extensive research and synthesis of a wide range of highly relevant sources.	Thorough coverage of most significant and relevant aspects of the topic. Key problems and challenges are clearly defined and discussed. Demonstrates strong research using a good range of relevant sources.	Good coverage of the main relevant aspects of the topic, although some important aspects may be missing or lack depth. Key problems are identified and discussed, although their definition or significance could be clearer. Uses an adequate range of relevant sources.	Limited but sufficient coverage of relevant aspects of the topics, with many important aspects missing or lacking depth. Some less relevant material may be included. Problems are only vaguely defined or discussed. Uses a limited range of references.	Insufficient coverage of the topic, with few relevant aspects addressed and important topics largely absent or replaced by irrelevant material. Problems are poorly defined or not identified. Little relevant research is evident.
Quality of technical analysis (8%)	High-quality technical analysis, including strong quantitative analysis and, where feasible, an eco-audit or equivalent analysis of impacts. Calculations of efficiencies, resource usage and potential environmental or economic benefits are appropriate to the scale of the proposal. Methods are clearly explained and easy to follow. Assumptions, scope and functional unit are clearly defined, where relevant. Arguments are logical, well justified and consider all important aspects. Uncertainties in results and conclusions are realistically estimated and discussed.	Detailed and well-developed technical analysis, including appropriate quantitative analysis. Where feasible, includes an eco-audit or equivalent analysis of impacts and relevant calculations of efficiencies, resource usage or potential benefits. Methods are clearly explained, with assumptions and scope generally well defined. Arguments are logical and justified, with consideration of the main relevant aspects. Uncertainties and limitations are appropriately considered.	Good technical analysis with some quantitative analysis and/or analysis of impacts. Includes relevant calculations, although these may be limited in scope or depth. Methods are generally understandable, although some assumptions, scope or other aspects may be unclear. Arguments are generally logical and justified but may overlook some relevant aspects. Some consideration of uncertainty and limitations.	Basic technical analysis, with some quantitative analysis and calculations undertaken. Analysis is generally generic or superficial, with limited depth or consideration of the implications of the results. Methods and assumptions may be unclear in places, and some relevant aspects may be missing. Arguments are largely descriptive and only partly justified. Limited consideration of uncertainty.	Inadequate technical analysis, with quantitative analysis and calculations largely absent or incomplete. Methods and assumptions are unclear or missing. Important aspects of the analysis are not considered. Arguments are poorly developed or unsupported. Little or no consideration of uncertainty in results or conclusions.

Quality discussion of Non-Technical Aspects (6%)	Comprehensive and detailed discussion of the major economic, political, social and other non-technical factors affecting translation to practice. Provides strong evaluation and comparison of solutions based on relevant non-technical objectives. Considers implementation issues and non-technical solutions where relevant, supported by evidence and quantitative/qualitative analysis where appropriate.	Strong discussion of most major economic, political, social and other non-technical factors affecting translation to practice. Provides good evaluation and comparison of solutions and considers relevant implementation issues and non-technical solutions.	Good discussion of several relevant economic, political, social and other non-technical factors, although some important factors may be missing or underdeveloped. Includes some evaluation and comparison of solutions and consideration of implementation issues.	Basic discussion of some relevant non-technical factors, with much of the discussion descriptive. Limited evidence of evaluation, comparison or quantification. Non-technical solutions or implementation issues are addressed only to a limited extent.	Inadequate discussion of economic, political, social or other non-technical factors. Important factors are missing or poorly understood. Little meaningful evaluation, comparison or consideration of implementation issues.
Originality & creativity of the proposed solutions (3)	Demonstrates a high level of originality and creativity in identifying and developing solutions that could support the chosen technology. Goes beyond obvious applications of materials engineering and identifies less intuitive or indirect opportunities. Provides new feasible ideas or connections that are not immediately apparent from the chosen technology.	Demonstrates a strong level of originality and creativity in identifying and developing solutions that could support the chosen technology. Goes beyond obvious solutions and identifies some less intuitive or indirect ways materials engineering could contribute. Develops ideas or connections that are not immediately obvious.	Demonstrates some originality and creativity in identifying and developing solutions that could support the chosen technology. Consider alternatives beyond the most obvious solutions, although the proposed ideas may not always be feasible.	Demonstrates limited originality and creativity. Proposed solutions are mostly obvious to the chosen technology, with limited consideration of alternative or less intuitive ways materials engineering could contribute.	Demonstrates little originality or creativity. Proposed solutions are generic, obvious or largely restate existing approaches, with little evidence of considering alternative ways materials engineering could contribute.
Presentation (3%)	Professional level presentation. Writing is clear, well organised and easy to follow, with a logical flow of discussion. Good use of high-quality figures/tables where appropriate. Report is appropriately structured and concise. Consistent referencing. Very few errors in spelling, grammar or formatting.	Very good presentation. Writing is clear, well organised and easy to follow, with a logical structure. Figures/tables are generally high quality and used effectively. Report is well structured and generally concise. Referencing is consistent. Only minor presentation issues.	Good presentation. Writing is generally clear and logically organised, although some aspects may be unclear or lack flow. Figures/tables are generally appropriate and relevant, although there may be some missed opportunities or inconsistencies. Some unnecessary detail or repetition may be present.	Adequate presentation. An attempt at logical structure is evident, but the report may be difficult to follow in places. Figures/tables are basic or limited, with several missed opportunities. Writing may lack conciseness or contain unnecessary detail. Some issues with referencing, spelling, grammar or formatting.	Poor presentation. Poor organisation and structure make the report difficult to follow. Irrelevant figures and tables. Writing lacks clarity and/or conciseness. Significant issues with referencing, spelling, grammar or formatting affect readability.
